

This is a **Windows + Git long-path problem**. Your PDF is inside a very deep folder structure, so Git cannot index the full path.

Recommended solution

Open **Git Bash** or Command Prompt inside your repository and run:

Bash

```
git config --global core.longpaths true
```

Then go back to your repository:

Bash

```
cd "C:\Users\adinalab3\Desktop\Teaching-Data-and-Notes"
```

Try:

Bash

```
git add .
```

Then:

Bash

```
git status
```

If everything is correct:

Bash

```
git commit -m "Add teaching data and notes"
git push
```

If it still gives `Filename too long`

Enable long paths in Windows as well.

Option 1 — Administrator PowerShell:

PowerShell

```
New-ItemProperty -Path "HKLM:\SYSTEM\CurrentControlSet\Control\FileSystem" `
-Name "LongPathsEnabled" -Value 1 -PropertyType DWORD -Force
```

Then **restart Windows** and run:

Bash

```
git config --global core.longpaths true
```

Finally:

Bash

```
git add .
```

Important

Your problematic path is:

```
github/Notes/New folder/CS-305 Computer workshop Course File/  
14 Continuous Assessment Record/  
•MID SEM II Question Paper with solution, Attendance Record, Result/  
-Question Paper/  
CS-304DIGITALSYSTEMS MIDTERMII.pdf
```

It is simply **too deeply nested**.

Better long-term solution

I recommend shortening the folder names. For example:

```
github/  
Notes/  
CS-305/  
Assessment/  
Question-Paper/  
CS-304-Digital-Systems-Midterm-II.pdf
```

Then run:

Bash

```
git add .  
git commit -m "Add course files"  
git push
```

First try this single command:

Bash

```
git config --global core.longpaths true
```

Then:

Bash

```
git add .
```

In most Windows 11 Git installations, that fixes this exact error.
